

Management and treatment of Hepatobiliary Malignancies have undergone major changes over the last years. The progress in interdisciplinary treatment options, perioperative management as well as in overall surgical expertise nowadays allow us to perform individually tailored treatment concepts for our patients with primary or secondary hepatobiliary malignancies even at advanced stages of disease. As in other fields of surgery minimal-invasive techniques such as laparoscopic or even robotic-assisted resections have also been established as standard techniques in individually selected patients. In combination with the recent achievements in neoadjuvant and adjuvant treatment concepts both disease-free as well as overall survival could be markedly improved in our patients.

The aim of this workshop “Management of Hepatobiliary Malignancy” is to discuss modern achievements in the interdisciplinary treatment of patients with hepatobiliary malignancy. Theoretical aspects of interdisciplinary treatment approaches, preoperative patient selection and perioperative patient management will be presented and updated while practical aspects of surgical techniques including minimal-invasive approaches will be demonstrated by international experts in the field as a practical course in the operating room.
